HONOR MODE FRAMEWORK
Developer Involvement Model for LLM Systems

Purpose

Honor Mode is a **systems** framework for designing behavioral infrastructure so that daily actions reliably serve long-term outcomes. It gives developers, architects, and leaders a shared model to move responsibly from sandbox experiments to live LLM production.

Core Principles

- **Behavioral Infrastructure**
  Design environments, defaults, and runbooks so “the right thing” is the easiest thing to do under pressure.
- **KPIs & Integrity**
  Treat KPIs (cost, latency, accuracy, safety) as integrity signals, not just performance numbers, and wire them into decisions, not dashboards only.
- **Sandbox-to-Production Continuity**
  Every experiment has a clear path: hypothesis, test, KPIs, guardrails, and criteria for graduation into production.

Developer Involvement Model

Developers in Honor Mode operate across three layers:

1. **Systems & Architecture**

- Define clear interfaces (APIs, schemas, contracts).
- Ensure observability (token usage, latency, error rates) is first-class.

Behavior & Workflows

- Align prompts, workflows, and human roles with measurable KPIs.
- Use feedback loops (alerts, reviews, retros) to adjust behavior.

2. **Presentation & Communication**
   - Render KPIs and narratives in HTML dashboards and reports.
   - Export to PDF for stakeholders who need stable, contextual reading.

Tooling Example

- **SGLang Scoring API**
  - Return token usage in /v1/score so teams can track cost & performance KPIs from sandbox to production.
  - Add tests and docs so downstream clients can rely on those fields.
- **Java & Web Clients**
  - Java services consume the scoring API, log KPIs, and enforce guardrails.
  - Web front-ends (HTML) present Empowerment Companion insights in a vivid, actionable way.
- **Empowerment Companion**
  - Human-facing layer that helps non-technical leaders interpret KPIs.

- Guides adjustments to prompts, policies, and workflows based on real system behavior.

Honor Mode Press

Honor Mode Press is the publishing and implementation arm of the Honor Mode framework:

- Captures applied case studies (e.g., CERT training, IAEM Bulletin articles).
- Produces media kits, reports, and guides that translate technical work into human-readable infrastructure patterns.

From Sandbox to Live Environment

1. Define the experiment and KPIs.
2. Implement the change (API, model, workflow).
3. Instrument token usage, latency, and safety signals.
4. Render results in HTML dashboards; export key views to PDF.
5. Use the Empowerment Companion to brief decision-makers.
6. Promote the pattern into production with clear runbooks and guardrails.
